

Nordic ID RF601

Easiness and efficiency

NORDICID

Nordic ID RF601 wireless efficiency

The multi-purpose Nordic ID RF601 is precisely what you want it to be. The application is developed for a host environment. This can be either a single PC or the company business system. The Nordic ID RF601 operates as a wireless terminal to make the application available to you wherever you need it.

The radio network for the data transmission is easy to construct using the powerful base stations. One base station can support several users simultaneously. The Base stations can be connected to the host computer via serial cable or directly to the Ethernet simply by plugging the network cable to the base station.

The Nordic ID RF601 is designed to fit into your hand. It is also made to last. The drop test shows that the RF601 can survive a fall from 1.2 meters on to a hard concrete floor with flying colours. The operating temperature is between -20° C and +55° C.

The Nordic ID RF601 features a large and clear display with an illuminated screen that is easy to read even in poor conditions. Robust buttons are made of wear resistant rubber silicone.

The Nordic ID RF601 is a wireless data collection terminal that extends the company data system right to where it is needed: goods inward, warehouse, shop floor and customer service, etc.

The Nordic ID RF601 can be used in several ways. By reading the barcode it will display the product price, delivery time or other needed information. In a stock take the number of items counted is entered straight into the stock accounting system from the Nordic ID RF601. You can sort out your reservations, place the orders and update your database anytime, anywhere. All this is achieved wirelessly and in real-time.

The Nordic ID RF601 is a barcode scanner, wireless keypad and a clear computer display housed in one compact and ergonomic handset. Equipped with the barcode scanner it weighs only approx. 260 grams*, so you can use it all day long.

* Depending on the scanner equipped

The Nordic ID wireless data collection system is used successfully in hundreds of companies. It is used, among others, for stock monitoring, reserving restaurant tables and tracking the flow of goods for an express delivery service.

The Nordic ID RF601 is part of a unique wireless data collection system. The system consists of radio handsets that are used to communicate with the host system via base stations using an efficient communication protocol. The host system

can be just a PC or a more complex computer system. The base station (or several) can be connected to the host system using an RS232 serial interface or to a LAN using an Ethernet serial converter. The application software runs on the host

system. This eliminates the need to program the Nordic ID RF601 handsets. It also makes software development and updating extremely flexible. What is more, the communication is rapid because it's real time!
