

## OPN STOCK INFORMATION SHEET

OPNStock provides a simple and intuitive inventory control solution designed specifically for high volume, low item-count sales environments (eg: web sales of individual items to the members of the public or sales from remote venues, exhibitions and shows etc.)

The solution includes PC database and reporting software, and OPN2001 mobile data collector or CPT8001 mobile terminal.

Use the data collector to log low item-count sales of product and receipt of goods by simply scanning the product barcode of each item sold or received.

Book higher item-count sales or receipts directly into the database using a barcode scanner attached to the PC, or remotely using the optional CPT8001 mobile terminal

OPNStock is affordable, fast and easy to implement, and accurate.

### PRODUCTS DATABASE

The system incorporates a master products database including the following data items for each product:

- Product Code + Secondary Product Code
- Product Description + Short Description
- Buy price + Sales Price
- Supplier Code + Product Group
- 4 User configurable fields
- Min Stock Level for re-order
- Quantity

### IMPORT STOCK

Freely add or edit stock via the PC keyboard or import existing products via text file if required.

### OPN2001 MOBILE DATA COLLECTOR

Low item-count sales and receipts can be quickly and accurately logged using the data collector by simply scanning the product barcode of each item sold or received.

Download the data collector to automatically adjust the central database stock levels and store a record of every individual transaction.

Higher item-count sales or receipts can be entered directly into the system database using a barcode scanner attached to the PC.

Entering a Reference No. for the transaction (or when downloading the data collector) allows subsequent reporting of product sold at a specific event, for example, or goods received against a specific GRN/ Purchase Order etc.

### CPT8001 MOBILE TERMINAL

Alternatively configure your system with the CPT8001 mobile terminal if required to remotely log higher item-count sales and receipts and gain the benefits of mobile stocktaking and price lookup at the terminal.

### STOCKTAKING

Perform a full or partial stocktakes, and generate reports of results and variances in moments.

### REPORTS

A wide range of management, tracking and stocktake reports are included as standard.

Stock based reports may be run against the products database to determine current stock levels and value, products below re-order level etc. Stock reports may be run for a specific Product Group or Supplier Group or for an individual Product Code, for example.

Transaction based reports may be run to list products received or despatched against a specific Purchase Order or Sales Order, for example or for a given date range etc.

A range of stocktake reports allows instant reporting of stocktake results and variances etc.

### BARCODE LABELS

Print barcoded stock labels from the ERSStock database using the optional label printer

## SPECIFICATION SUMMARY

	<b>OPNStock</b>
Compact SQL Database	✓
Data Import	✓
Booking of Product Sales and Receipts	✓
Mobile booking of Sales and Receipts	✓
